SUMMARY

Data-driven analyst from **NIT Bhopal** specializing in Python, SQL, and Tableau. Proven track record of leveraging A/B testing and statistical modeling to optimize marketing ROI, mitigate customer churn, and extract actionable business intelligence that drives product strategy.

EDUCATION

MANIT Bhopal (Maulana Azad National Institute of Technology) — 2022 – 2026
B.Tech — Mathematics and Data Science

Gokuldas Public School, Khargone, MP — 2021
12th CBSE — 93.4%

Sophia Secondary School, Khetri Nagar, Rajasthan — 2019
10th CBSE — 88.2%

TECHNICAL SKILLS

Languages	Python, SQL
Data Visualization & BI	Tableau, Matplotlib, Seaborn
Analytics & Modeling	A/B Testing, Time-Series Analysis, Hypothesis Testing, Churn Modeling, Cohort Analysis
Libraries	Pandas, NumPy, SciPy, Statsmodels

PROJECTS

Customer Churn & Revenue Impact Analysis [GitHub] — *Python · SQL · Matplotlib · Seaborn*

- Engineered an end-to-end churn analytics pipeline for an OTT subscription dataset (**12+ KPIs**) to mitigate MRR leakage and optimize customer lifetime value (CLTV).
- Identified a **25.00% overall churn rate**, surfacing that monthly-contract subscribers churned at **56.52%**—which is **6.7 times higher** than the 8.40% annual-contract rate.
- Directly attributed **$8,619.75/mo** in Monthly Recurring Revenue (MRR) leakage and **$211,369.01** in CLTV erosion to high-risk customer cohorts.
- Recommended prioritizing **Premium annual-plan retention strategies** over Basic monthly acquisitions to maximize long-term revenue yield.

Marketing Campaign A/B Testing & Analysis [GitHub] — *Python · Pandas · SciPy · Statsmodels*

- Spearheaded A/B testing and Exploratory Data Analysis (EDA) on a **1,000-day** marketing dataset to rigorously evaluate Facebook vs. AdWords campaign performance.
- Conducted independent T-tests and Cointegration analysis, statistically proving **Facebook's superior conversion rate** and uncovering a **stable, long-term equilibrium** between ad spend and conversions.
- Delivered data-driven strategic recommendations for **dynamic budget allocation**, identifying micro/macro-seasonal trends that optimized **Cost Per Conversion (CPC)** and maximized overall campaign ROI.

Vendor Performance Analysis & Profitability Optimization [GitHub] — *SQL · Python · Tableau · Statsmodels*

- Conducted comprehensive correlation analysis to uncover that higher-priced items do not yield higher margins, subsequently identifying **198 brands** with low sales volume but **high profit margins** for targeted strategic promotions.
- Discovered severe vendor concentration risk (top 10 buyers accounting for **65.69% of revenue**). Statistically validated through hypothesis testing that shifting focus to lower-volume buyers would increase average margins from **31.17% to 41.55%**.
- Identified **$2.71M in stagnant, unsold inventory** tying up capital. Demonstrated that fulfilling large-scale bulk orders reduced unit costs by **up to 72%**, directly improving organizational sales efficiency.
